Hiring Manager

Dear Hiring Manager,

Your team needs more than someone who can discuss architecture. It needs someone who can turn an ambiguous requirement into a deployed, reliable system and remain accountable through handoff. I bring nine years of enterprise technical experience, paired with eight years running an electrical and telecom contracting business.

At Meta (contract), I delivered enterprise AI, cloud identity, and workplace automation, including AI business agents across Instagram and WhatsApp and integrations connecting Meta Workplace with Okta, Entra ID, Google Workspace, SAML SSO, HR ticketing, and facilities systems. At Whatnot, I supported platform reliability, developer tooling, CI/CD, release validation, cloud infrastructure, and real-time streaming and messaging.

Through United Uprising, I built and maintain a local-first AI research harness spanning retrieval, indexing, connector orchestration, terminal agents, and reversible context compression, along with WebGL geospatial visualization and interchange pipelines. My field background adds a useful discipline: systems must survive real users, physical constraints, deadlines, and imperfect documentation.

I would bring your organization a practical architecture mindset: clarify the problem, choose maintainable systems, make integrations observable, and carry the work through deployment. I welcome the opportunity to discuss how my experience can strengthen your engineering, AI infrastructure, deployment, or technical operations team.

Sincerely,

Chance Mathis
